                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 152, Application US/09923779

Patent No. US30020076721A1

GENERAL INFORMATION:
APPLICANT: Pyle, Ruth A.
APPLICANT: Yu, Jiangchun
APPLICANT: Tu. Jiangchun
APPLICANT: Wu, Jiangchun
APPLICANT: CAIOS, Michael D.
TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY
TITLE OF INVENTION: AND DIAGNOSIS OF PANCREATIC CANCER
FILE REFERENCE: 210121.553
CURRENT APPLICATION NUMBER: US/09/923,779
CURRENT FILING DATE: 2001-08-06
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Indels

Sequence 695, Application US/09925297

Patent No. US20020081659A1

GENERAL INFORMATION:

APPLICANT: Rosen et al.

TITLE OF INVENTION:

CURRENT APPLICATION NUCLEIC ACIDS, Proteins and Antibodies
FILE REFERENCE: PA105

CURRENT APPLICATION NUMBER: US/09/925,297

CURRENT FILING DATE: 2001-08-10

PRIOR FILING DATE: 2000-03-08

PRIOR FILING DATE: 1999-03-12

NUMBER OF SEQ ID NOS: 928

SOFTWARE: PATENTIN Ver. 2.0

SEQ ID NO 695

The invention relates to novel serine process's designated bases?

The invention also relates to vectors and transformants comprising BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 can be varied; and an mBSSP5 knockout mouse. The invention additionally encompasses anti-BSSP5 knockout mouse. The invention additionally encompasses anti-BSSP5 antibodies and methods of production of such antibodies, methods of BSSP5 detection using the antibodies, and the antibodies, methods of BSSP5 detection using the antibodies, and the medical conditions, e.g., pancreatitis; A method for detecting pancreatitis comprising measuring BSSP5 concentration in the blood or urine, and a pancreatitis diagnostic agent containing an anti-BSSP5 untibody is also disclosed. Nucleocides encoding BSSP5 were initially isolated in a human brain conserved regions of serine proteases. The BSSP5 serine proteases and nucleocides encoding them are useful in detecting homologues, mutants and polymorphic variants in biological samples (e.g., blood, urine, brain, prostate gland, placenta, testis, pancreatitis and prostatic hypertrophy. Sequence AAB11710 represents murine BSSP5 (hBSSP5), and sequence AAB11711 represents murine BSSP5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ő

The invention relates to novel serine proteases designated BSSP5

(AABI1710-B11711), and to nucleic acids encoding them (AAA61733-A61734).

The invention also relates to vectors and transformants comprising BSSP5 nucleic acids; transgenic animals in which the expression level of BSSP5 can be varied; and an mBSSP5 knockout mouse. The invention additionally encompasses anti-BSSP5 antibodies and methods of production of such antibodies, methods of BSSP5 detection using the antibodies, and the use of BSSP5 proteins or fragments as diagnostic markers for certain medical conditions, e.g., pancreatitis. A method for detecting medical conditions, e.g., pancreatitis concentration in the blood or urine, and a pancreatitis diagnostic agent containing an anti-BSSP5 antibody is also disclosed. Nucleotides encoding BSSP5 were initially isolated in a human brain cDNA library using degenerate PCR primers (AAA61744-A61745) based on conserved regions of serine proteases. The BSSP5 serine proteases and nucleotides encoding than are useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

AAS AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens have cytostatic, cancer antigens have cytostatic, cancer antigens have cytostatic, cancer antigens have cytostatic, contraceptive, nootropic, immunomodulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

Agonists and antagonists to the antigens can be screened for. The pancreatic cancer antigen polynucleotides can be used to detect and hybridisation probes that can be used in chromosome mapping, linkage and alagnostic methods. The proteins can be used to densic and diagnostic methods. The proteins can be used to penerate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and target the polypeptides, including the productive, gastrointestinal, pulmonary, cardiovascular, renal or reproductive, dastrointestinal, pulmonary, cardiovascular, renal or proteins can be used to prevent neural, immune system, muscular, ceproductive, dastrointestinal, pulmonary, cardiovascular, renal or proteins can be used to prevent neural, immune system, mesular, ceproductive, dastrointestinal, pulmonary, cardiovascular, renal or prevent expection of the present invention.
                   Human; pancreas; pancreatic cancer; pancreatic cancer antigen; detection; datacetis; ldentification; cytostatic; neuroprotective; mootropic; immunomodulatory; relaxant; contraceptive; gynaecological; antiinflammatory; cardiant; gene therapy; chromosome mapping; linkage analygsis; ilssue identification; itssue typing; forensic; neural; immune system; muscular; reproductive; gastrointestinal; pulmonary; cardiovascular; renal; proliferative.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid that is a pancreatic cancer antigen for preventing, treating, or ameliorating a medical condition, particular pancreatic cancer, or for use in assays for diagnosing a pathological condition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 11; Page 966; 1379pp; English.

The present invention relates to the isolation of novel human proteases, and the nucleic acids encoding them. The sequences of the invention are useful for treating diseases and disorders such as cancers (e.g. breast, colon, lung), immune-related diseases and disorders (e.g. inflammatory diseases and asthma), cardiovascular diseases (e.g. restenosis and coronary thrombosis), brain or neuronal associated diseases, metabolic disorders (e.g. diabetes, obesity), inflammatory disorders (e.g. rheumatoid arthritis and psoriasis), central or peripheral nervous system diseases, migraines, pain, sexual dysfunction, mood disorders, attention disorders, cognition disorders, hypotension, hypertension, psychotic disorders, neurological disorders (e.g. Alzheimer's disease, parkinson's disease) and dyskinesias. infections caused by human immunodeficiency virus (HIV), and non-viral infections such as ocular disease (e.g. glaucoma) and macular degeneration. AAU82702-AAU82760 represent the novel human proteases of Length 263; DB 23; 56.1%; Score 684.5; 55.0%; Pred. No. 8e-5 Live 36; Mismatches Best Local Similarity 55.0 Matches 127; Conservative Similarity 263 AA; Sequence Query Match

It was included in a review of sequence homologies of several plasminogen activators. Plasminogen is the principal serine protease zymogen in the extracellular fluids of vertebrates. Its active form, plasmin, is implicated in pericellular proteolysis associated with a wide range of physiological and pathological processes. Plasminogen expression is regulated by plasminogen activators which hydrolyse a peptide bond in plasminogen to spontaneously convert it to plasmin . The sequence homology analysis has identified a six amino acid peptide involved in plasminogen activation. This peptide is particularly useful when inserted between amino acid residues 644 and 645 of full length human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plasminogen. Novel plasminogen activators have been made based upon the plasminogen activation/recognition site of plasminogen binding proteins. The polypeptides are useful in preparing thrombolytic agents for treating blood clotting disorders such as heart attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polypeptide with plasminogen activator activity useful as thrombolytic agent for treating blood clot disorders e.g. heart attack, comprises 10 amino acid peptide fragment for recognition or activation of

ADG-15 is an extracellular serine protease. It was found that TADG-15 is over-expressed in ovarian tumours. TADG-15 protein or its fragments of 9-20 residues that lack TADG-15 protease activity are useful for a risk of getting an individual against TADG-15, having, suspected of having or at risk of getting cancer. Furthermore, the TADG-15 gene can be used as a diagnostic or therapeutic target in cancer. The present sequence was used in a sequence homology alignment with the catalytic domain of TADG-15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

AAC98773 to AAC99231 encode the human pancreatic cancer associated proteins, called pancreatic cancer antigens, given in AAB54068 to AAB54466. The human pancreatic cancer antigens have cytostatic.

AAB54466. The human pancreatic cancer antigens have cytostatic, cancroprotective, nootropic, immunondulatory, relaxant, contraceptive, gynaecological, cardiant and antiinflammatory activities, and can be used for in gene therapy. The polynucleotide and proteins can be used for preventing, treating, or ameliorating a medical condition or in assays for diagnosing a pathological condition or a susceptibility to one in a subject. Binding partners to the proteins and the activity of the control of proteins can be identified. The pancreatic cancer antigens can be used to detect, treat or prevent pancreatic disorders, especially cancer.

Composition and antagonists to the antigens can be used to design nucleic catch hybridisation probes that can be used to design nucleic and hybridisation probes that can be used to design nucleic and diagnostic methods. The proteins can be used to generate antibodies which are used to purify, detect and target the polypeptides, including both in vivo and in vitro diagnostic and therapeutic methods. The proteins can be used to generate antibodies both in vivo and in vitro diagnostic and therapeutic methods. The

The product is useful in rejuvenating the elasticity of the arterial wall, and improving unusual serum lipid levels and lipoprotein metabolism.
                                                       Pancreas elastase prodn. used to improve lipoprotein metabolism -
comprises isolating RNA coding elastase, synthesising single and
double chain cDNA and introducing recombinant into host
                                                                                                                                                                                                         14;

The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

The present invention describes an expression vector (I) comprising in frame and in order, a presequence, and a cloning site for the in frame insertion of catalytic domain cassette. (I) can be used as a modulator of proteins expressed from a zymogen activation construct. The recombinant catalytic domain of serine protease is useful for identifying compounds modulating the activity of proteases. Is expressed and activated from the zymogen activation construct. A method from the present invention comprises combining a modulator of the modulator on the protein of a protease and mesuring an effect of the modulator on the protein preferably inhibiting or enhancing its enzymatic activity or stimulation or inhibition of proteolysis mediated (by the expressed catalytic domain. The present sequence represents a fusion gene with a human serine protease catalytic domain protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ,,
                                                                                                                                                                      Expression vector for producing recombinantly producing serine protease domains, comprising a presequence, a prosequence, and a cloning site for the insertion of catalytic domain cassette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    166 VGNVTPAHLQQVALPLVTVNQCRQYWDSS-----ITDSMICAG--GAGASSCQGDSG 215

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
